Abstract

We survey directors and investors on the objectives, constraints, and determinants of CEO pay. 67% of directors would sacrifice shareholder value to avoid controversy on CEO pay, implying they face significant constraints other than participation and incentive compatibility. These constraints lead to lower pay levels and more one-size-fits-all structures. Shareholders are the main source of constraints, suggesting directors and investors disagree on how to maximize value. Respondents view intrinsic motivation and reputation as stronger motivators than incentive pay. They believe pay matters to CEOs not to finance consumption, but because it affects perceptions of fairness. The need to fairly recognize the CEO's contribution explains why flow pay responds to performance, even though CEOs' equity holdings already provide substantial consumption incentives, and why peer firm pay matters beyond retention concerns. Fairness also matters to investors, with shareholder returns an important reference point. This causes CEO pay to be affected by external risks, in contrast to optimal risk sharing.

JEL classifications: G34, G38, M12, M52

Keywords: Executive Compensation, Contract Theory, CEO Incentives, Fairness, Survey

* We are indebted to the directors and investors who took the time to fill in the survey and, in particular, those who agreed to be interviewed. We are grateful to Vikas Agarwal, Ashwini Aggarwal, Ulf Axelson, Cynthia Baloch, Brian Blank, Felipe Cabezon, Joanna Chen, Pierre Chaigneau, Oliver Cover, Vicente Cunat, Peter Cziraki, Naveen Daniel, Ingolf Dittmann, Daniel Ferreira, Xavier Gabaix, Neil Golborne, Juanita Gonzalez-Uribe, John Graham, Moqi Groen-Xu, Cam Harvey, Torsten Jochem, Swami Kalpathy, Robert Macrae, Ernst Maug, Gaizka Ormazabal, Daniel Paravisini, Cameron Peng, Anjana Rajamani, Orkid Russell, Zach Sautner, Kelly Shue, Hong Zhou, seminar audiences at Arizona, Arizona State, Colorado, Connecticut, CUHK-Shenzhen, Delaware, EPFL/Lausanne, Erasmus University Rotterdam, ESSEC, Federal Reserve Board, Georgia State, HKUST, IÉSEG, Indiana, LBS, LSE, Lugano, Maryland, NHH, Nottingham, Rutgers, South Carolina, Texas Christian University, Toronto, Tulane, Utah, and conference participants at the BI Conference on Corporate Governance, CICF, the Drexel Gupta Governance Institute Online Seminar Series, EFA, EFMA, the Florida State University Suntrust Beach Virtual Conference, FMA, the Istanbul Finance Seminar Series, the Minnesota Virtual Corporate Finance Talks, NFA, and the PRI Academic Network Week for helpful comments. We thank Candice Boclé, Stephen Cahill, Jonathan Dawson, Alan Giles, Steve Golsby, Sandy Pepper, Mike Power, Erica Serpico, and Ben Yeoh for beta-testing the survey, Sai Zhang for outstanding research assistance, and Katty Paredes and especially Janet Chater for coding the questions. We thank the Institute of Directors, Investment Association, Non-Executive Directors Association, and LBS Advancement (Ian Frith and Sarah Jeffs) for their help in survey distribution. We gratefully acknowledge research support from the LBS AQR Asset Management Institute and an LSE STICERD grant.

1. Introduction

How to design executive pay is a first-order decision for every firm. Pay is critical for attracting, retaining, and motivating a CEO, and affects the wider company beyond the CEO – high pay may demotivate employees and damage a company’s customer reputation. Even more broadly, CEO pay across the economy influences the public’s perception of capitalism. As a consequence, CEO pay receives more attention than nearly every other routine corporate decision. Boards have dedicated remuneration committees, investors have a special “say-on-pay” vote, and pay is highly regulated.

Due to its importance, it is critical to understand how CEO pay is set. Academics typically study this question through theorists building models and empiricists testing the models’ predictions. While a great deal has been learned through these methods, they have limitations. First, data only documents the outcome of an optimization problem and not the underlying program that led to it. Even if data is consistent with a model, a very different model may have generated it. Second, many key ingredients of compensation models are difficult to measure and thus test.

This paper surveys non-executive directors and institutional investors on how they set or influence pay. Our first goal is to understand the *objectives* and *constraints* of contract design, and thus the underlying program. Our second goal is to identify the *determinants* of pay, by investigating factors that theories deem relevant but are unobservable, or that prior models have overlooked. We distributed the survey in late 2020, receiving responses from 203 non-executive directors of FTSE All-Share companies and 159 investors in UK equities. Most questions allowed respondents to add free-text comments, and we conducted 14 post-survey interviews. The answers reveal several interesting results, organized into four groups:

Objective and constraints

Our first question asks respondents to rank the importance of three goals when setting CEO pay. 65% of directors view attracting the right CEO as most critical, while 34% prioritize designing a

structure that motivates the CEO. For investors, these figures are 44% and 51% respectively. This reversal reflects a theme that recurs throughout our survey – directors view labor market forces, and thus the participation constraint, as more important than investors, who prioritize the incentive constraint. Only 1% of directors and 5% of investors view keeping the level of pay down as their primary goal. This is consistent with CEO pay being a small percentage of firm value, while hiring a subpar CEO or providing suboptimal incentives has potentially large effects.

However, boards feel restricted by far more than the participation and incentive constraints focused on by standard models. 67% of directors admit that they are willing to sacrifice shareholder value to avoid controversy on CEO pay – from parties such as proxy advisors, employees, and customers. Surprisingly, the strongest constraint is the need to obtain investor support, even though this should be automatic if boards are setting pay optimally. Instead, directors believe that shareholder guidelines, paradoxically, harm shareholder value. 77% report that such constraints have forced them to offer a lower level of pay, and 72% an inferior structure.

Most models of CEO pay take the “shareholder value” view that pay is set by a single principal, a shareholder-aligned board. The main alternative is the “rent extraction” view, whereby boards are captured by CEOs and thus do not seek to maximize value. However, our free-text fields and interviews suggest a third perspective – directors and investors share the same objective (shareholder value), but view the world differently. One possibility is that directors better understand the CEO labor market, whereas shareholders push for changes that would violate the CEO’s participation constraint or demotivate her (“uninformed investors”). Another is that boards overestimate the value of their CEO or underestimate their latitude to improve pay (“uninformed boards”).

To help disentangle these interpretations, we ask the 77% of directors who were forced to offer lower pay about the consequences. While 7% report that the CEO left, and 13% that they hired a less expensive CEO, 41% admit that there were no adverse effects. This result is meaningful, since any

self-serving bias would discourage this response. Thus, at least in some cases, boards underestimated their latitude to cut pay. However, 42% reported that the CEO was less motivated, suggesting that the level of pay affects incentives, in contrast to standard theories.

Incentives and variable pay

There is greater agreement on the second set of questions – the role of financial incentives in motivating CEOs. Both boards and shareholders believe they are relevant but of secondary importance. The CEO’s intrinsic motivation and personal reputation are seen as most important, yet are absent from nearly all theories. Notably, directors view CEOs’ career concerns, the focus of a large literature, as third-order: fewer than 20% view the risk of being fired or a move to a larger firm as an important motivator.

Both boards and investors believe that motivating the CEO is the main reason for offering variable pay, despite viewing financial incentives as secondary. The free-text responses and interviews suggest that financial incentives reinforce intrinsic and reputational incentives. CEOs believe it is fair to be rewarded financially for good performance; perceived unfairness would erode their intrinsic motivation. As one respondent stressed, “the retrospective acknowledgement of exceptional performance is important.” Separately, an increase in realized pay signals the CEO’s performance to outsiders, boosting her reputation.

These responses suggest that incentive pay may work through different channels to standard models. In these models, the CEO only improves firm value if her utility from consuming the resulting pay increment exceeds the effort required to do so – the contract offers sufficient *consumption incentives*. Our respondents instead suggest that variable pay provides *ex-post recognition*. A CEO does not need the extra pay to finance consumption, but believes it is fair to be recognized for a job well done.

The importance of ex-post recognition has two implications. First, it suggests that a CEO assesses her pay not only for the consumption utility it provides, but also against what she deems to be a fair reward. This fair reward is believed to be affected by at least two reference points – the CEO’s contribution to the company and the pay of her peers.

Second, flow pay plays a special role not provided by portfolio incentives. In standard theories, only total incentives matter – it is irrelevant whether they stem from changes in flow pay or the value of existing equity. Fairness models are similarly silent about where a fair reward should come from. Empirically, incentives from existing equity are much greater, so standard measures of CEO incentives ignore flow pay. However, changes in flow pay provide greater ex-post recognition, because they require a discretionary decision by the board and are voted on by shareholders. They are also publicly disclosed, boosting the CEO’s reputation. Thus, they may be important even if the CEO holds significant equity.

Two other reasons for variable pay are strongly supported by both directors and investors: attracting or retaining a high-ability or hard-working CEO, and for the CEO to share external risks with investors and stakeholders. The second reason is surprising and contradicts standard theories, since it implies inefficient risk-sharing. It is, however, consistent with a fairness model in which directors and investors also evaluate CEO pay relative to a set of reference points that includes shareholder returns.

When asked about the split between fixed and variable pay, neither directors nor investors assign much relevance to CEO risk aversion and firm risk, the split’s main determinants in standard models. This indicates a wide gulf between the models and real-world practice.

Pay levels

Our third set of results concerns the level of pay. We first ask what determines the pay of a new CEO. Both directors and investors view CEO ability as most important. Unexpectedly, pay at peer

firms is seen as more important than the new CEO's actual outside options, such as pay at her prior firm and at other firms she could move to. One explanation, supported by the free-text fields and interviews, is that peer compensation matters not only because it determines the CEO's alternatives, but also because it is a reference point she uses to assess whether her pay is fair.

When asked about increases in expected pay for incumbent CEOs, both directors and investors state that the primary justification is good recent performance. This is surprising given the substantial equity holdings that CEOs have, but is consistent with changes in flow pay providing ex-post recognition. Other justifications receive only minor support.

Directors also report that decreases in expected pay are rare, with 77% never having implemented one. Interestingly, while directors believe that good recent performance justifies pay increases, they do not believe that poor performance justifies decreases. Several interviewees explained that pay cuts would demotivate the CEO and, if performance were poor enough to warrant a cut, they would fire her instead. The two justifications for pay decreases with the most support are external pressure and financial constraints, likely because they are less detrimental to the CEO's sense of worth.

“Suboptimal” pay practices

Finally, we study the reasons for apparently suboptimal pay practices. The first is the limited use of relative performance evaluation. Directors support three explanations, absent from existing theories, for why they do not filter out industry conditions from all performance measures. One is again fairness – CEOs should benefit from an upswing since investors and stakeholders do.¹ The other two reasons are practical – it can be difficult to find suitable peers for some firms, or to observe peer performance for some performance measures. Explanations proposed by existing models, such as keeping pay competitive with peers during upswings, receive little support.

¹ Even if investors are benchmarked, the benchmark is often a market rather than an industry index, so they benefit from industry upswings.

A second apparently suboptimal practice is the short-term nature of many pay incentives. Here, directors' and investors' views differ sharply. 78% of investors believe the CEO would make better decisions if incentives were more long-term. Fewer than 6% agree with each of three potential concerns – that long-term incentives are less effective motivators, would jeopardize CEO retention or recruitment, or would require a costly adjustment in pay level. In contrast, directors view incentives as already sufficiently long-term, and only 21% believe that further lengthening would improve decisions. Instead, they view all three concerns as important.

Contribution to the literature

This paper builds on the literature on CEO compensation, recently reviewed by Murphy (2013), Edmans and Gabaix (2016), and Edmans, Gabaix, and Jenter (2017). It is also related to other corporate finance surveys, such as Graham and Harvey (2001), Graham, Harvey, and Rajgopal (2005), Brav et al. (2005), Ben-David, Graham, and Harvey (2013), and Graham, Harvey, and Puri (2013). A unique feature is that we survey both directors and investors, allowing us to investigate how their views differ. The above papers study executives only; others study investors only, such as McCahery, Sautner, and Starks (2016), Krueger, Sautner, and Starks (2020), and Gompers et al. (2020). CEO pay is arguably the decision on which investors have the greatest influence, given their say-on-pay votes, and thus an interesting setting to compare their views with directors.

This paper proceeds as follows. Section 2 discusses the motivation for the survey, explains how we conducted it and aimed to address the methodology's limitations, and describes the context of UK executive pay. Section 3 presents the results on the objectives and constraints of CEO pay design, Section 4 addresses the level of pay, and Section 5 its structure. Section 6 concludes, and Online Appendix A discusses who sets CEO pay in practice.

2. Motivation, Method and Context

2.1 Motivation: Standard Theory vs. Real-World Practice

A key goal of the survey is to guide future compensation theories. The vast majority of compensation models contain three basic elements: an objective function that is firm value net of CEO pay, an individual rationality (“IR”) constraint, and an incentive compatibility (“IC”) constraint.² These three elements are so standard that they are frequently written down without any justification. However, they may not capture how CEO pay is actually set in practice – hence the potential value of a survey in scrutinizing them.

Starting with the objective function, it assumes that the only downside of high CEO pay is that it directly reduces shareholder value. However, it may also demotivate employees or harm the firm’s customer reputation. Moreover, the board may have a different objective function, such as to avoid losing a say-on-pay vote. Turning to the participation constraint, it binds in most models. This suggests that, if a CEO’s pay were reduced by \$1, she would leave, but it is not clear whether this is the case in practice. The incentive constraint may also not bind, if intrinsic motivation or reputational concerns are sufficient to motivate the CEO.

Considering the whole program together, it ignores many other potential constraints. Boards and CEOs do not negotiate pay in a vacuum. Norms on what investors and stakeholders deem acceptable may limit the level of pay or prevent its structure from deviating substantially from peer practices. The CEO’s preferences, reflected in the IR and IC, may be richer than a simple function of effort and consumption. Real-world CEOs likely also care about their reputation, fairness, and being appreciated by directors and investors.

² There may be several IC constraints, to govern not only the CEO’s effort level but also her choice of risk, project horizon, and private savings, but all IC constraints seek to influence the CEO’s action(s).

2.2 Surveys Versus Archival Research

The standard empirical methodology is archival research. This has several advantages, such as large datasets, objectivity, and the ability to control for multiple factors. However, it also has limitations. For example, it is difficult to measure key theoretical determinants of CEO pay, such as the CEO's risk aversion and cost of effort. Even if an empirical proxy can be found, a statistical relationship could have multiple interpretations. A finding that CEO pay is sensitive to performance could be because variable pay is used to incentivize effort, to screen out low-ability CEOs, or to ensure the CEO shares risks with investors and stakeholders. While archival research studies *what* drives pay, it is less able to investigate *why* these factors drive pay.

The survey methodology itself has limitations, and we have endeavored to design the survey to attenuate, if not eliminate, them. First, respondents may interpret the questions differently to how we envisaged. We engaged in extensive beta-testing of the survey and provide free-text fields after each question to establish whether there were persistent misinterpretations. A second is the Friedman (1953) "as if" critique, that contract designers may act in accordance with a theory but be unable to articulate it. Conversely, they may give a high score to a response because it sounds logical. We reduce this risk by not explaining the rationale behind a response. For example, when exploring the determinants of incentives, we ask about the importance of "how risky the firm is" rather than "the riskier the firm is, the weaker incentives are as they expose the CEO to too much risk." While the latter explanation might identify the mechanism more precisely, a respondent might score this option highly because the explanation seems sensible.

Third, respondents may misreport their answers. In addition to guaranteeing anonymity, we tried not to ask questions that would likely lead to misreporting. For example, we did not ask directors why pay is so high, as this may prompt rationalizations even if pay were unjustified, but instead asked

what would happen if pay were lower. Finally, our questions may be limited by the “academic paradigm”, i.e., restricted to what academic literature suggests is relevant. We addressed this concern by having a practitioner coauthor, beta-testing the survey to see if we had omitted important factors, and including free-text fields. If the free-text fields systematically suggested a response outside our set of options, we explored it in interviews.

2.3 *The UK Context*

We study executive pay in the UK for a number of reasons. First, the UK lies between the US and Europe in both the level and structure of pay, rather than being an outlier. A study on the US is less likely to generalize to Europe, and vice-versa, given the differences in their pay levels and structures. Second, the UK does not have any differential tax treatment that would cause boards or investors to prefer one form of pay over the other (e.g. Section 162(m) in the US which, prior to 2018, allowed qualified performance-based pay to be exempt from the \$1 million cap on tax deductibility), or asymmetric accounting or disclosure implications. Thus, any responses are unlikely due to tax, accounting, or disclosure factors that are specific to the UK. Third, the UK was the first country to adopt say-on-pay, introducing legislation in 2002. Therefore, UK investors have significant experience in evaluating, voting on, and engaging on CEO pay.

We believe that most of our conclusions will generalize to other countries. Not only are UK pay levels and structures not an outlier, but also there has been growing convergence in both elements across the globe (Fernandes et al., 2013). Say-on-pay has become widespread throughout the world, with the EU Shareholder Rights Directive imposing a similar regime to the UK. In both the US and Europe, major investors are setting expectations on pay and voting in an increasingly consistent manner, and many of those attitudes (e.g., on relative performance evaluation) were formed in the UK. That being said, there remain some differences between the UK and other countries; for example, options are used far less than in the US. We thus did not ask questions on topics where the UK may

be an outlier (e.g. the mix of stock vs. options) as the answers might not be generalizable. In addition, we will later highlight particular results that may not generalize.

A UK company must establish a Remuneration Committee (RemCo) of independent directors to set the pay of executive directors. The RemCo is required to put two say-on-pay votes to the company's investors. At least every three years, it puts its remuneration policy to a binding "policy vote." This sets the framework within which the RemCo must make pay decisions; any deviation is illegal. Every year, the decisions the RemCo makes within the policy are put to a non-binding "implementation vote." Firms are required to disclose total realized pay, known as the "single figure." This includes salary, annual bonus, and cash and equity earned³ as part of "long-term incentive plans" (LTIPs).

Beyond say-on-pay, boards are also constrained by the 2018 revision of the UK Corporate Governance Code (the "Code") and investor guidelines; violations can lead to significant voting opposition. For example, the revised Code requires the pension contributions of executive directors to be aligned with the wider workforce. In 2018, CEO pensions had contribution rates of up to 50% of salary, while employee schemes were below 10%, so the Code led to large reductions for CEOs.

The survey was carried out in the context of the COVID-19 pandemic, in which many firms reduced CEO pay either due to concerns about fairness with the wider workforce or financial difficulties. The recent history of pension reductions and the COVID-19 context enabled us to study the impact of pay reductions, which are typically rare. More generally, To reduce the risk that responses were skewed by COVID-19, none of our questions asked about current or recent actions, but the objectives, constraints, and determinants of pay in general. Any questions about actions taken by respondents refer to these actions in general terms, e.g. "Have you *ever* significantly decreased the

³ This is based on when performance conditions are tested. The equity earned may not yet be paid out, since there may be additional holding periods. New grants of equity are disclosed separately from the "single figure," together with the performance conditions that govern their vesting.

target quantum of pay for an incumbent CEO?” (emphasis added) or “Do you filter out industry conditions from all performance measures?”

Online Appendix B provides additional contextual information plus stylized facts on UK CEO pay.

2.4 Survey Design and Delivery

We benefited from extensive feedback on our questions before launching the survey. We obtained feedback from academics by presenting the questions at conferences and seminars, and sending them to leading researchers. We sent several drafts to the UK government’s department of Business, Energy, and Industrial Strategy, which has significant experience in administering surveys to guide government policy. We beta-tested the survey with directors, investors, and compensation consultants to ensure that they were interpreting the questions as we intended, check the survey was not too long (our target was 15 minutes), and explore if we were missing key dimensions. Most of these beta tests occurred via Zoom, where the practitioners answered the questions “aloud,” so we could see how they were interpreting them.

We launched the survey in November and December 2020. To encourage responses, we donated £100 for each completed survey (up to a total of £25,000) to the UK’s National Health Service COVID appeal, and offered respondents the option to receive a draft of the working paper before its public release.⁴ We administered the survey using the Qualtrics online platform, offering respondents a generic (rather than individualized) link to guarantee their anonymity. Except for the demographic questions, we randomized the order of responses within each question.

We surveyed two types of respondent. The first was non-executive directors of FTSE All-Share companies (excluding investment trusts), which we identified from CapitalIQ and BoardEx; we

⁴ To opt in to receive the draft, after completing the survey, participants were invited to add their email address. This final step was optional; approximately half the respondents filled it in. Many respondents were not identifiable from their email.

attempted to contact every director. The second was investors in UK equities. There are two relevant types: asset managers and asset owners (such as pension funds). Some asset owners vote directly on CEO pay; others give asset managers guidance on how they should vote. Within an asset manager/owner, there are both fund managers and governance specialists (otherwise known as “stewardship” or “responsible investment” specialists). The latter coordinate voting and engagement across the asset manager/owner’s funds.

We attempted to contact every fund manager of all UK equity funds listed on Trustnet, a well-known database of funds offered in the UK, as well as every Head of Responsible Investment of signatories to the UK Stewardship Code⁵ and members of the UK Sustainable Investment and Finance Association. For some, the main contact for responsible investing was a Chief Investment Officer (“CIO”), fund manager, or stock analyst. Online Appendix A provides further details on our distribution procedure.

In total, we contacted 1,312 directors of 421 firms and 556 investors at 231 asset managers or asset owners. We obtained responses from 203 directors and 159 investors; 170 (132) answered every question. This corresponds to a response rate of 15.5% for directors (13.0% counting only directors who answered every question) and 28.6% (23.7%) for investors. This compares favorably with response rates of 4-15% for the survey papers referenced in Section 1.⁶ After receiving the survey results, we interviewed 14 respondents to explore the reasons behind their responses. The interviewees were a mix of investors (both asset managers and asset owners, and fund managers and governance specialists) and directors across industries.

⁵ Asset manager and asset owners who sign up to the voluntary UK Stewardship Code pledge to exert governance on their investee companies.

⁶ The results presented are based on all responses, but do not change materially if we only include respondents who answered every question.

Table OA1 presents summary statistics on the director respondents. 39% were from the FTSE 100, 36% from the FTSE 250 (the next 250 largest firms), and 22% from the FTSE Small Cap index. 27% of respondents were board chairs, 33% were RemCo chairs, and 24% were RemCo members. They represented a broad set of industries, with financial services being the most common, consistent with the composition of the UK stock market.

Table OA2 contains summary statistics for the investor respondents. 80% were from asset managers, 8% from asset owners, and 13% from hybrid asset manager/owners such as pension funds. 52% of respondents were governance specialists, 26% fund managers, 8% stock analysts, and 6% CIOs. Fund managers, stock analysts, and CIOs are primarily evaluated according to investment returns, and thus may be more concerned with the impact of pay on firm performance. (Where there is no confusion, we will use “fund managers” to encompass these three categories). Governance specialists may be more sensitive to the societal consequences of pay. However, the responses from fund managers and governance specialists were generally similar, and we will highlight the few cases in which they differed.

3. The Objectives and Constraints of CEO Pay Design

3.1 Objectives

Our first set of questions aims to study directors’ and investors’ objectives and the constraints they are operating under. The program in Section 2.1 involves three stages, assuming a given effort level: (1) minimizing the level of pay subject to (2) the structure inducing the required effort level (i.e. the IC being satisfied) and (3) the CEO accepting the contract (i.e. the IR being satisfied). Accordingly, our first question (Q1) asks respondents to rank these three elements (“Rank the importance of the following goals when setting CEO pay”).

Table 3 illustrates the results. Both directors and investors view minimizing the level of pay (“keep the quantum of pay down”) as least important, with 91% of directors and 85% of investors ranking it last.⁷ This result is consistent with CEO pay being a small percentage of firm value for most firms. It is also consistent with “shareholder value” models where the CEO’s talent (Gabaix and Landier, 2008) and effort (Edmans and Gabaix, 2011) have multiplicative effects on firm value, making it worthwhile to pay the level required to attract and incentivize a talented CEO.

In contrast, 65% of directors and 44% of investors view hiring and retention (“attract/retain the right CEO”) as most important, while 34% of directors and 51% of investors rank the structure of pay (“design a structure that motivates the CEO”) most highly. This reversal is a theme that recurs throughout the survey – directors perceive labor market forces, and thus the participation constraint, as crucial, while investors assign greater importance to the incentive constraint.

There are two potential reasons for this divergence. The first is that directors and shareholders have different objectives. One possibility is that shareholders wish to maximize shareholder value but the board is captured by the CEO, or does not wish to exert effort to restructure pay or recruit a new CEO – and cites competitive pressures as an excuse. The board is also undiversified and thus may not push for a contract that improves shareholder value in expectation but risks leading to a CEO departure. We use “weak boards” to capture all these reasons. A second possibility is that shareholders do not wish to maximize shareholder value. Asset managers may maximize fund flows, which requires reflecting client concerns about CEO pay even if non-value-maximizing.⁸ Alternatively, investors may maximize value across their portfolio and thus take externalities into account – for example, lowering pay at one firm may make it easier to lower pay at others.

⁷ “Quantum” is the term most commonly used by UK practitioners for the target level of pay, i.e., expected pay.

⁸ See Dasgupta, Fos, and Sautner (2021) for a survey of the literature on flow-concerned asset managers.

The second explanation is that both boards and investors have the same objective – shareholder value – but disagree on how to maximize it. This disagreement may stem from two sources. One is “uninformed investors.” Investors underestimate labor market pressures, the difficulty of the CEO job, or the value created by a CEO. Boards better understand these issues, particularly since most directors have executive experience. Several free text responses from directors supported this view. One noted: “Good people are leaving the plc [public limited company] world for private equity in droves. Fund management companies should not throw stones.”⁹ The other potential source of disagreement is “uninformed boards” – directors may underestimate their latitude to restructure pay, or the depth of the CEO labor market in case a restructuring causes the CEO to leave. Later responses show that investors believe many boards to be weak or uninformed.

3.2 Constraints

Our next set of questions studies whether directors and investors perceive constraints over and above the IR and IC considered by standard theories. Q2 asked directors “How large a sacrifice in shareholder value would you make to avoid controversy on CEO pay?”, and investors the analogous question “how large a sacrifice in shareholder value would you tolerate firms making to avoid controversy on CEO pay?” (For brevity, for future questions we will include the analogous wording for investors in only the results table, not the main text).

Notably, 67% of directors would sacrifice shareholder value to avoid controversy, and 56% of investors would tolerate directors doing so (Table 4, Panel A). This suggests that boards and investors feel restricted by far more than the IR and IC. We next asked about the sources of controversy that might lead to these restrictions. To the respondents who would tolerate a sacrifice, we asked Q2b,

⁹ Potentially suggestive of uninformed investors, particularly governance specialists, this is one of the few questions to which fund managers and governance specialists responded differently. 64% of fund managers ranked “attract/retain the right CEO” and 36% “design a structure that motivates the CEO” as most important – almost exactly matching the result for directors.

“How important is it to avoid controversy with the following parties?” This question, and the majority of our remaining questions, is scored according to a Likert scale with -2 representing “not at all important”, 2 representing “very important”, and 0 being neutral.¹⁰ We will often report results in the form “x%/y”, where x is the percentage of respondents who selected 1 or 2, i.e. important or very important, and y is the average rating. For brevity, we will use “important” to refer to “important or very important”. Also to avoid cumbersome prose, we will sometimes say “our results suggest that x” rather than “our results suggest that directors and investors believe that x”; however, it is important to bear in mind throughout that our survey only reports directors’ and investors’ perceptions.

Table 4, Panel B shows that 88% of directors view it as important to avoid controversy with investors; this response also received by far the highest average rating (1.24). This result is surprising. With symmetric information and objectives, controversy with investors would be avoided by maximizing, not sacrificing, shareholder value. Directors could simply offer the optimal contract and investors would agree that it is the optimal contract. Instead, paradoxically, directors believe they have to sacrifice shareholder value to satisfy shareholder requirements. One director wrote that “shareholders appoint RemCos and then often seek to micromanage their duties.” This result suggests that directors and investors disagree significantly on what the optimal contract is.

Directors rated employees as the second most important source of controversy (63%/0.69), consistent with concerns about internal equity that we will revisit later. The third highest was proxy advisors (48%/0.45). Like the “investors” result, this high score is interesting, as proxy advisors should be acting in shareholders’ interest. Instead, they may not be maximizing shareholder value, perhaps because they impose one-size-fits-all rules (Iliev and Lowry, 2015; Cabezón, 2020; Jochem, Ormazabal, and Rajamani, 2021). Indeed, Table OA5 reports that 71% of directors agree that proxy

¹⁰ The original survey labelled the options 1 to 5, but we have rescaled them from -2 to 2 so that 0 is the neutral score. For some future questions, -2 represents “strongly disagree” and 2 represents “strongly agree”; the scale for each question is shown in the relevant table.

advisors influence pay more than they should. Shareholders, on the other hand, believe the main sources of controversy to be employees (82%/1.26), customers (75%/1.14) and policymakers (65%/0.92). 44% of shareholders rated “other investors” as an important source of controversy, suggesting differences in opinion among investors on the optimal contract.

3.3 *Constraints and the Level of Pay*

We next drill down into the consequences of the constraints from avoiding controversy, focusing on the level of pay in this subsection and the structure in the next. Because these questions are about the actual CEO pay contracts offered, we asked them to directors only.

Q12a (“Have any of the following ever caused you to offer a lower quantum of CEO pay than you would like?”) studies whether constraints affect the level of pay. In addition to external constraints, we also include two internal ones. The first is “restrictions from our existing approved pay policy,” given investors’ binding policy vote. (This result will not generalize to the US since there is no binding policy vote, unlike the UK and EU). The second is “unwillingness to deviate substantially from how we have paid in the past,” given the potential influence of history.

77% of directors report that at least one of these non-standard constraints has forced them to offer lower pay than they would like (Table 5, Panel A). 60% offered less pay to avoid the “risk of investor opposition,” and 53% to avoid the “risk of ‘vote against’ recommendation from a proxy advisor.” A minority feel constrained by the existing pay policy (44%), the need to avoid controversy with employees, the media, customers, or policymakers (37%), or past pay practices (28%).

To the 77% of directors who answered “Yes” to at least one constraint, Q12b asked “Did this lower quantum ever lead to the following consequences?” In many “shareholder value” models, CEOs are at their participation constraint, so the only possible outcomes are that the current CEO leaves or the firm hires a different CEO. However, only 7% report that the CEO left, and 13% that they hired a less expensive CEO.

By far the most popular responses are not predicted by standard theories. 42% of directors reported that “the CEO was less motivated.” In classical models, motivation depends only on the sensitivity and not level of pay. When the CEO chooses whether to work, she calculates the marginal disutility of effort and compares it to the marginal increase in consumption utility ($u'(c)$) from increasing effort. Instead, this response suggests that pay may matter *per se*, not just for the extra consumption that it can buy. The CEO compares her pay c to what she believes is fair; if she is paid unfairly, she may be demotivated and reduce effort. This is consistent with the “gift exchange” efficiency wage model of Akerlof (1982), where a CEO reciprocates a gift of fair pay by providing discretionary effort, and Herzberg’s (1959) view that fair pay is a “hygiene factor” that demotivates if not provided.¹¹ As one director said about the consequences of a lower quantum of pay, “[the CEO] still did the job, but his morale was affected negatively.” Another wrote: “There is first a test of pay fairness by the CEO, then after that, it is about building reputation” – reputational concerns incentivize CEOs to perform, but only if they first believe their pay to be fair.

Formally, “fair” pay is pay that exceeds a set of reference points. This suggests that the CEO’s utility function may be of the form $U(w - f(\mathbf{X}))$, where w is the CEO’s wage, \mathbf{X} is a vector of reference points that determine what she believes to be fair, and $U(\cdot)$ exhibits a discontinuity at zero. One potential functional form for f is $\max(x_1, x_2 \dots)$ in which case the CEO’s pay must exceed all reference points, else she perceives it as unfair. The dependence on w (rather than c) highlights how the CEO’s utility depends on the wage *per se*, rather than the consumption utility it provides. Future questions will shed light on what these reference points might be.

The second-most reported effect of lower pay was “there were no adverse consequences” (41%). This high frequency is meaningful – response bias would work against directors admitting that

¹¹ Herzberg’s two-factor (or motivation-hygiene) theory proposes that employees have higher-order psychological needs (“motivators”), such as achievement, recognition, and responsibility, which cause job satisfaction, and lower-order needs (“hygiene factors”), such as fair pay and comfortable conditions, which cause dissatisfaction and demotivate if not given.

external pressures led to them taking a value-creating action that they would not have done otherwise. Thus, in many cases, directors had greater latitude to cut pay than they thought, consistent with weak or uninformed boards. For example, even if the CEO is unhappy about lower pay, intrinsic motivation or reputation may ensure she remains incentivized.

There are two caveats to this interpretation. One is that some reductions in CEO pay were caused by the COVID-19 pandemic or by coordinated pressure on executive pensions (see Section 3.2), which reduced pay across the market. Lowering pay in isolation may have led to adverse consequences. A second is that uncertainty may have made boards' unwillingness to cut pay ex-ante optimal due to a high ($100\% - 41\% = 59\%$) likelihood of negative effects. This is particularly the case if retaining and motivating the right CEO are more important than the level of pay, as reported in Table 3.

3.4 *Constraints and the Structure of Pay*

We next investigate how these non-standard constraints affect the structure of pay. Q13a asked “Have any of the following ever caused you to offer an inferior structure of CEO pay to what you would like?” Table 6, Panel A presents the results. Similar to Q12a on pay levels, boards perceive binding constraints. 72% of directors report that they were forced to offer an inferior pay structure, mostly because of proxy advisors (54%) or investors (54%).¹²

To the 72% of respondents who selected “Yes” to at least one constraint, we ask Q13b, “Was the structure inferior in the following ways?” Panel B shows that 69% reported that they had to “follow market practice more,” likely to comply with one-size-fits-all rules applied by investors or proxy advisors. For example, one director said that his board “could have used more creative non-standard

¹² Restrictions from the approved pay policy (40%), risk of controversy with other parties (29%), and pay history (16%) also received similar response rates to Q12a. We offered two additional options specific to the structure of pay. One is restrictions from regulation or governance codes (36%), since the Code requires executives to hold equity for at least five years and be subject to clawbacks. The second is “adverse tax, accounting, or disclosure implications” (10%). Since UK rules are generally applied consistently across all forms of pay, this low response rate may not generalize to other countries where tax, accounting, or disclosure rules create distortions.

vehicles but didn't." This result echoes Cabezon (2020), who shows that US pay packages have become more homogenized in recent years.

The second most common consequence was offering less upside for good performance (65%). This is interesting since investors, the main source of constraints, view motivating the CEO as important (Table 3). One interpretation is that investors believe that too much upside has perverse consequences. A second is that investors are concerned that the media or customers may object to high pay, even if justified by performance. 57% of directors were forced to use more performance conditions, perhaps because investors and stakeholders demand that pay be linked to particular measures. An interviewee complained that different investors have different objectives and each asks for a performance condition to reflect theirs.

In free-text entries and interviews, several directors and investors explained that they would prefer to pay CEOs like owners, providing large equity stakes, small annual bonuses, and no LTIPs. This would entail unlimited upside for good performance and no performance conditions, violating some of the above constraints. One director wrote that "we have held off changing from LTIPs to share award schemes for some of the above reasons." Another pointed out that large equity stakes are used successfully within private firms. However, when a company goes public, it immediately gets benchmarked against other public firms and thus has to offer bonuses and (capped) LTIPs "because this is what everyone else does." Several investors stated that they would like CEOs to be paid in restricted shares, without performance targets attached, to achieve maximum alignment, but that other investors or proxy advisors would object because such a scheme does not fit their standard models.

3.5 *Summary*

Our questions on the objectives and constraints of pay yield the following conclusions:

1. Directors view attracting and retaining the CEO (satisfying the IR) as the most important goal of pay, while investors believe that motivating the CEO (satisfying the IC) is more important. Both view reducing the level of pay as least important.
2. Boards feel constrained by far more than just the IR and IC. 67% of directors would sacrifice shareholder value to avoid controversy on CEO pay, and 56% of investors would tolerate directors doing so.
3. Directors view avoiding controversy with investors as the main constraint, suggesting that boards and shareholders disagree on the optimal contract. Directors also view proxy advisors as a significant constraint; directors and especially investors view avoiding controversy with employees as important.
4. These additional constraints matter. 77% of directors reported that constraints forced them to offer a lower level of pay. 41% of directors admitted that doing so had no adverse consequences, while 42% stated that it reduced the CEO's motivation. The latter is inconsistent with standard models, but is consistent with pay being a hygiene factor and unfair pay being a demotivator.
5. 72% of directors report that constraints forced them to offer an inferior pay structure. This typically involved less tailoring and reduced upside for good performance.

4. The Level of Pay

This section studies the determinants of the level of pay. We investigate the pay of a new CEO upon appointment (Section 4.1) separately from subsequent increases (Section 4.2) and decreases (Section 4.3). Section 4.4 analyzes whether boards and investors believe the level of pay can be cut.

4.1 Pay of a New CEO

Q3 asks: “How important are the following factors in determining the target quantum of pay for a new CEO?”, and aims to capture the determinants of the ex-ante expected value $E[c]$.¹³ The results are in Table 7. “The new CEO’s ability” is the most popular response for both directors (85%/1.29) and investors (90%/1.49), consistent with talent-based models such as Gabaix and Landier (2008) and Terviö (2008). Perhaps less expected are the high responses to “how attractive our firm is to run (e.g. prestige, risk, complexity)”.¹⁴ Many critics of high pay believe that the CEO job involves little disutility, so it should not be a significant driver of pay. In contrast, this response was the second most popular option for investors (61%/0.61) and third for directors (68%/0.76). In several free-text fields and interviews, directors stressed how difficult the CEO job is – involving extremely long hours, being constantly in the media, and facing pressures not faced by other executives.

“CEO pay at peer firms” was the second most popular response for directors (66%/0.82) and third highest for investors (49%/0.46). Notably, both sets of respondent ranked it higher than “the new CEO’s pay in their previous position” (42%/0.26 for directors and 23%/-0.21 for investors) and “the new CEO’s other employment options” (58%/0.55 and 43%/0.26). If participation (IR) were the only constraint, then pay only needs to persuade the new CEO to leave her prior position and choose the firm over alternative opportunities. Instead, the results suggest that pay at peer firms is relevant even if the CEO could not move to those firms, e.g. due to there being no vacancies. Several interviewees argued that how a CEO is paid compared to her peers reflects the *worth* the board and investors attach

¹³ In the academic literature, the level of pay refers to the ex-ante expected value $E[c]$, but this concept is not easy to translate into practitioner terminology. In beta-testing, the “level” of pay was interpreted as realized pay, in which case it is mechanically linked to factors such as CEO ability, as a high-ability CEO will hit bonus thresholds. “Expected pay” was interpreted as the amount of pay that the CEO expects to receive, i.e., believes she deserves. The beta-testing revealed that “target quantum” best captured $E[c]$. In addition, at the start of the “Level of Pay” section, we stated “In this survey, the quantum of pay should be taken to refer to the target level of total remuneration set by the remuneration committee.”

¹⁴ Prestige and complexity aim to capture both the non-pay benefits and difficulties, i.e., the net disutility, of the CEO’s job. Both free-text fields and interviews only referred to prestige and complexity, not risk. This is consistent with the empirical finding of Albuquerque, Albuquerque, Carter, and Dong (2020) that risk has little effect on the level of pay.

to her. One director wrote that “relative competition (why does he earn more than me?) is very significant as an issue of pride.” Thus, peer pay may determine what the CEO views as fair and be a reference point included in *X*. Investors viewed all three of the above determinants as less important than directors, consistent with them placing less weight on labor market conditions.

The free-text fields highlighted an additional determinant of pay absent from most models – internal equity considerations. One director emphasized the importance of “the multiple of the CEO pay to the average within the company”; another responded that “internal proportionality is most important.” Several investors made similar statements.

4.2 *Increases in Pay for an Incumbent CEO*

Q4 asks “What causes you to increase the target quantum of pay for an incumbent CEO?” Table 8 illustrates the results; as with the prior question, there is general agreement between directors and investors. Both rated “good recent CEO performance” the highest, with support of 76%/0.98 from directors and 75%/1.05 from investors. While intuitive, it may seem unnecessary to reward high performance with increased target pay, given that almost all CEOs have substantial equity holdings. Empirically, the incentives from changes in the level of pay are so small compared to those provided by CEOs’ equity holdings (Jensen and Murphy, 1990; Hall and Liebman, 1998) that they are typically ignored when calculating incentives.

The free text responses and interviews suggest that pay rises are used to provide *ex-post recognition*. A fund manager explained in an interview that pay rises are important to acknowledge good performance, and that no talented person stays in a job where she does not feel appreciated. Another pointed out that a pay rise is so small compared to firm value that it costs the company very

little. Thus, if the CEO is denied it, she infers that the board and shareholders do not value her highly and may leave or be demotivated.¹⁵

These findings help us refine the notion of fairness used by CEOs. Existing research on fairness does not differentiate between flow pay and changes in wealth; in experimental settings, subjects have no pre-existing wealth and only receive flow pay.¹⁶ If flow pay and changes in wealth are fungible, fairness concerns would not necessitate pay increases, since a CEO's equity already rises upon good performance.

Our results suggest instead that flow pay plays a special role in addressing CEOs' fairness concerns by providing *recognition*. A pay increase provides internal recognition because, unlike the revaluation of equity, it requires a discretionary decision by the board and must be approved by shareholders. It provides external recognition because it is observable and thus boosts the CEO's reputation. Several interviewees explained that a pay rise is a more public endorsement than the revaluation of equity, since it is disclosed as part of the "single figure".

These responses suggest that the CEO's perception of her contribution to her firm determines another reference point included in X . This is also a potential micro-foundation for why CEOs might have higher discount rates than shareholders – not because they need pay for consumption, but because changes in current pay lead to perceptions of fairness and recognition.

All other responses received less than 50% support from both directors and investors. The second most common response from directors was "increases in firm size" (46%/0.37; 45%/0.17 from investors). Some free-text comments and interviewees argued that size matters because of complexity, consistent with the findings of Gayle and Miller (2009). Others explained that CEOs benchmark their pay against peers of similar size to assess whether it is fair. As one director argued, "benchmarking

¹⁵ A separate reason for increasing pay is to retain the CEO if good performance increases her outside options. However, the support for "increased threat of CEO leaving" (43%/0.25 for directors and 30%/-0.06 for investors) was much lower.

¹⁶ Fehr, Goette, and Zehnder (2009) survey the evidence for the importance of fairness in employee pay.

gives comfort that there's fairness, transparency, and objectivity."¹⁷ One potential reason is that firm size and peer firm pay are more observable than other potential determinants of pay, such as CEO talent or disutility, so linking pay to them gives the CEO comfort that pay is set fairly.

Directors ranked "increases in pay at peer firms" (44%/0.26) significantly higher than investors (27%/-0.17), again consistent with directors perceiving labor market pressures to be stronger. Some investors were strongly opposed to responding to increases in peer firm pay. Both sets of respondent considered peer firm pay a far less important determinant of changes in pay for an incumbent than for the pay of a new CEO. This is consistent with Kahneman, Knetsch, and Thaler's (1986) evidence on the reference point employees use to assess whether pay is fair – peer firm pay for new hires, and last year's pay for incumbents.

The low responses to "other changes that reduce the attractiveness of the pay package (e.g. adding holding periods)" (-0.11/28% for directors and 0.01/30% for investors) are surprising since, in theory models, it is the value of the entire package that needs to exceed the CEO's outside option. An interviewee explained that the components of CEO pay are negotiated in isolation, consistent with narrow framing. The board and CEO negotiate base salary first, then the incentive components, and then restrictions such as holding periods. It is unlikely for the CEO to accommodate a board's demand for longer holding periods by asking for an increase in the already-negotiated base salary. What came out of the free-text fields is that significant increases in the level of CEO pay are surprisingly difficult. Many directors believe that large pay increases risk controversy, unless there has been a visible change to the size or complexity of the firm that can be used as justification. One explained that "It is pretty much impossible to increase the target pay of an incumbent CEO in the UK. It might be

¹⁷ In assignment models, such as Gabaix and Landier (2008), an increase in firm size does not lead to an increase in pay if the firm retains the same CEO and her talent is unchanged – since her outside option is unaffected, pay should not rise.

possible with a large acquisition that changes the scale and complexity substantially”; another stated “substantial increases would only come if the job gets markedly bigger/more complex.”

In the same vein, and consistent with the free-text entries for Q3 (Table 7), several free-text responses argued that it was difficult to increase CEO pay significantly faster than overall workforce pay. This suggests that fairness concerns also matter for directors and investors, not just the CEO. Their perceived cost of compensation may be not only the direct cost c , but $c + g(c, Y)$ where g is a function and Y is a vector of reference points (potentially different from X), such as worker pay, CEO pay in peer firms, or last year’s pay. These fairness concerns may arise either because directors and investors are concerned about fairness themselves, or believe that other stakeholders are, such as employees, customers, and – for investors – their clients.

4.3 *Decreases in Pay for an Incumbent CEO*

We now turn to decreases in pay. We first asked directors, in Q5a, “Have you ever significantly decreased the target quantum of pay for an incumbent CEO?” Table 9, Panel A shows that only 23% of directors responded “Yes.”¹⁸ Combined with the difficulty in significantly increasing pay, this suggests that directors’ main decision variable is the change in pay rather than the level, analogous to the findings of Lintner (1956) and Brav et al. (2005) for dividend policy. We interviewed directors to understand why pay cuts are so infrequent. One stated that if there were ever a justification for cutting the CEO’s target level of pay, you would instead fire her. Another director explained that a pay cut communicates that the board has downgraded its assessment of the CEO’s worth, and a third said that, as a consequence, cutting a CEO’s pay is effectively firing her. This suggests that another reference point in X is the prior year’s pay.

¹⁸ 65% of investors responded “Yes” to the analogous question “Have you ever requested significant decreases to the target quantum of pay for an incumbent CEO?” This 65% is not directly comparable to the 22% response from directors, since investors hold stakes in many companies and so are more likely to have requested decreases in at least one firm.

To the respondents who answered “Yes”, Q5b asked “What caused you to decrease the target quantum of pay for an incumbent CEO?” Here, unlike for increases in pay, there were significant discrepancies between investors and directors. The five factors that standard theories predict should drive reductions in pay (poor CEO performance, decreases in firm size, changes in attractiveness at your firm, changes in attractiveness at other firms, decreases in pay at peer firms) were the five least popular options for directors, with all average ratings being negative. In contrast, the investor responses were similar as for increases in pay – investors believe that these factors should drive both increases and decreases in pay symmetrically, just as theory predicts.

One potential explanation for this asymmetry is that directors are more concerned about the motivational or retention consequences of pay cuts. Investors’ most popular reason to cut pay was poor CEO performance (70%/0.96), but such a cut may erode the CEO’s sense of worth. CEOs may also see pay cuts because of changes in pay at peer firms or their own job getting easier as unfair, as these changes are out of their control. Recall, however, that directors view increases in peer firm pay and job complexity as valid justifications for pay rises. This echoes Garvey and Milbourn (2006), who find that CEOs are rewarded for good luck but not penalized for bad luck.

Instead, directors’ three most common reasons to cut pay had no analogy in the question about increases (Q4). The most popular response (46%/0.15, versus 27%/-0.28 for investors) was “external pressure to reduce pay.” The free-text responses highlighted two recent causes of external pressure – the COVID-19 pandemic, and the controversy about executive pensions. A second popular reason was “your firm encountering financial constraints” (51%/0.07 for directors, 58%/0.53 for investors).¹⁹

¹⁹ This was one of the few responses that differed according to firm size (35%/-0.50 for directors in the FTSE 100 versus 78%/1.00 for FTSE Small Cap firms), consistent with financial constraints being more important and CEO pay being a larger fraction of profits in smaller firms.

A third, and unexpected, justification to cut pay was “the CEO requesting it” (41%/-0.37).²⁰ While contrary to almost any model, it can be justified by the CEO having a sense of fairness or wanting to pre-empt controversy. One director wrote: “I was the incumbent CEO and asked for a reduction to reflect reduced complexity and intensity of role.” Another director said that it should not be up to the board to be tough on pay; a CEO should be tough on her own pay to show that she is sensitive to the environment. Taking these three reasons together, directors see pay cuts as plausible if they can be attributed to external pressures or financial constraints, or are requested by the CEO. Unlike cuts in response to bad performance, such cuts do not challenge the CEOs’ sense of her worth.

In their free-text responses, several investors stressed another justification for pay decreases absent from standard models – that pay is simply too high, and thus cuts are justified even without any change in circumstances: “the total compensation is unreasonably high”, “the quantum of pay was insanely high relative to anything – a formula gone wrong.” In shareholder value models, pay is always set optimally, so it should only change when parameters change. In contrast, many investors believe that pay was not optimal to begin with. There were no such responses from directors.

4.4 *Why Is CEO Pay So High?*

Our final questions on the level of pay aim to understand why CEO pay is so high. These are difficult questions to ask directly, as many formulations might lead to directors claiming that high pay is justified by CEO ability or market forces. We thus asked “If your firm reduced the target quantum of pay of its next CEO by 1/3 compared to its current CEO, what might happen?” We focused on CEO transitions as this is when a board has greatest flexibility to reset CEO pay. We chose a reduction of 1/3 in total pay because it is large yet not implausible. In the vast majority of companies, such a reduction would still leave the CEO being the highest-paid employee.

²⁰ We did not offer this response to investors as the CEO would make such a request to the board, not to them.

Table 10 illustrates the results, and again shows a significant disparity between directors and investors. Only 10% of directors agreed that “there would be no adverse consequences” (average score -0.96). Their strongest concern was “we would recruit a lower quality CEO” (59%/0.66). Several respondents emphasized that reducing the pay of one firm in isolation without corresponding reductions in the market would be dangerous. This indicates that they believe their CEO talent pool to be shallow, consistent with prior evidence that many firms struggle to replace CEOs who unexpectedly depart (e.g., Jenter, Matveyev, and Roth, 2021).²¹

Directors’ second greatest concern was “the CEO would be less motivated” (46%/0.38). This is consistent with Table 5, Panel B, and suggests that the level of pay has motivational consequences missing from standard models. Just over half agreed that “it would create undesirable pay compression between the CEO and other executives” (51%/0.36). This concern is also absent from most models, which focus on CEO pay in isolation. One potential mechanism is that compression reduces tournament incentives (Lazear and Rosen, 1981; Kale, Reis, and Venkateswaran, 2009). However, free-text fields or interviews cited this reason only once. Instead, they suggested that pay disparity is required for fairness – the CEO is worth more than other executives or suffers more disutility. One interviewee explained that “the more you do for the company, the more you should be paid; if the CEO isn’t doing more, she shouldn’t be CEO”. Another highlighted that CEOs are under even more pressure and public scrutiny than others. A third explained that reduced pay disparity would “disrupt the natural order of things and the hierarchies within the organization”, and that this concern applies beyond the CEO. If a CFO were paid less than the commercial director, even if this were dictated by market forces, the finance function would view itself as being less important.

²¹ This also reconciles our results with Table 5, Panel B, where only 13% of directors stated that constraints that lowered pay led to them hiring a less expensive CEO. Several UK firms recently reduced pay due to market-wide constraints (COVID-19 and the pressure on pensions), and the decreases were much smaller than 1/3.

Thus, while prior responses suggest that directors want CEO pay to not exceed certain levels, these additional fairness concerns imply that pay should also not fall short of other reference points. One potential functional form for $g(c, Y)$ may be $g_1(c - y_1) + g_2(c - y_2)$, where $g_1(\cdot)$ exhibits a discontinuous increase at 0 (the cost of CEO pay increases if it is disproportionate to worker pay or shareholder returns), and $g_2(\cdot)$ exhibits a discontinuous decrease at 0 (the cost also increases if CEO pay is not sufficiently above the pay of other top executives).

Investors were much more open to cutting CEO pay than directors. Their most popular response was that “there would be no adverse consequences” (33%/-0.02, with 35% neither agreeing nor disagreeing). Fewer than a quarter agreed with each of the negative consequences. Thus, many investors believe it is possible to reduce CEO pay by as much as 1/3. Several explained that, even if the board ends up recruiting a different CEO, she would be less materialistic rather than less capable. A fund manager claimed that “CEOs should not just be motivated by quantum of compensation – that suggests they have the wrong person;” a governance specialist stated that “[the CEO] might have a hissy fit ... then the board should reconsider if this person is appropriate for the role.”

Investors’ view that CEO pay is often unjustified was also reflected in their responses to Q15a: “Do you believe the overall level of CEO pay is too low, too high, or about right?” 77% of investors view pay as too high (Table OA3). We then asked these 77% why it is too high, and 86% agreed that “boards are ineffective at lowering it even though they should.” Thus, many investors view CEO pay as excessive, and they blame boards for it.

4.5 *Summary*

Our questions on the level of pay yield the following conclusions:

1. Directors believe that significant cuts to the level of pay would markedly worsen the quality and motivation of the CEO. The level of pay affects motivation by affecting perceptions of fairness, in contrast to standard models.

2. Many investors, in contrast, believe that there would be few adverse consequences of pay cuts, even if made by one firm in isolation. Instead, they view a CEO transition as an opportunity to reset the level of pay. 77% of investors believe that pay is too high, which they attribute to boards being weak.
3. Both investors and directors believe that good recent performance should increase expected pay, even though most CEOs have substantial consumption incentives from their equity holdings. Ex post recognition of performance is seen as important because CEOs care about fairness and reputation.
4. Directors view themselves as not starting from a blank sheet of paper. They believe it is difficult to increase pay, and even more difficult to decrease pay, in response to firm-specific changes or changes in the outside option. In contrast, investors believe that such changes should drive both increases and decreases in pay.
5. Ability is seen as the most important determinant of a new CEO's pay. The (dis)utility of a CEO job is another important driver, suggesting significant cross-sectional variation.
6. Pay in peer firms affects new CEO pay even more than alternative employment opportunities and the pay at the CEO's prior job. This appears to be because peer firm pay affects what is viewed as fair, rather than because of labor market competition.
7. CEO pay levels are affected by internal comparisons. Directors and investors believe there should be a substantial gap to other top executives, but also that the gap to the wider workforce should not be too large.

5. The Structure of Pay

This section studies the structure of pay. In Section 5.1, we first ask what directors and investors believe motivates a CEO. Section 5.2 asks why companies offer variable pay, and Section 6.3 targets

the split between fixed and variable pay. Sections 5.4 and 5.5 explore why two key predictions of contract theory are not always implemented in practice – long-term incentives and relative performance evaluation.

5.1 *What Motivates a CEO?*

Q7 asks “What motivates your CEO to perform strongly?” Table 12 shows the results, which are generally similar for directors and executives. Most models assume that financial incentives are the only motivator. While the support for “incentives from bonuses, LTIPs, equity, or future pay increases” was high (76%/0.98 for directors and 68%/0.83 for investors), it was only the third highest-rated response for both groups.

Instead, by far the strongest perceived drivers of CEO effort were “intrinsic motivation” (92%/1.55 for directors and 91%/1.50 for investors) and “personal reputation” (91%/1.40 and 96%/1.60). Both are absent from almost all contract theories.²² Personal reputation scored highly even though we offered separate responses for the financial benefits of a superior reputation (pay increases and labor market consequences). This suggests that simply being seen to do a good job is an important aspect of reputation. An investor said that “There is a common misperception that pay or career progression motivates CEOs to do a good job. [Performance] comes from intrinsic motivation, passion for the job, and maybe a concern with reputation.”

The free-text responses suggest that incentive pay provides ex-post recognition of performance, and that it interacts with intrinsic motivation and reputational concerns (we will use “intrinsic incentives” as an umbrella term for these two motivators). The CEO values incentive pay not because she needs it to afford consumption – as one investor stressed, “all CEOs are going to take care of most human needs in terms of finances” – but because it is recognition that she has performed well. One

²² Carlin and Gervais (2009) and Bettignies and Robinson (2018) are rare exceptions. Bénabou and Tirole (2003) study how extrinsic incentives affect intrinsic motivation, but not the reverse.

director stated that “primary motivation comes from inside, but pay is important as a signal to the CEO and the market of the value placed on them by the board.”

“The quantum of pay” (55%/0.55 for directors, 37%/0.21 for investors) is seen as another important motivator, inconsistent with most theory models but consistent with the importance of fairness.²³ One director explained that “principle and sense of fairness tends to matter a lot.”

Finally, even though career concerns have been a focus of the literature on CEO incentives since Fama (1980), they are not seen as important by our respondents, especially directors. “The potential to move to a bigger firm” received support of only 18%/-0.53 from directors (46%/0.37 from investors), and the “risk of being fired” only 11%/-0.88 (25%/-0.20). The lack of incentives from a potential upward move is consistent with the fact that incumbent CEOs are rarely being hired away (Cziraki and Jenter, 2021). In relation to firing risk, one interviewee explained that boards hire CEOs that are confident in their ability to succeed, so they should not be motivated by firing risk.

5.2 *The Motivation for Variable Pay*

In Q8, we ask “Why do you offer the CEO variable pay?” Note that practitioners interpret variable pay as elements of flow pay that are sensitive to performance, and do not include the CEO’s existing equity holdings.

Table 13 reports the results. The most popular response was “to motivate the CEO to improve long-term shareholder value” (89%/1.46 for directors and 87%/1.36 for investors). Thus, even though directors and investors believe that intrinsic incentives are the main motivators, financial incentives are important to reinforce them – in contrast to common arguments that they crowd them out. Free-text fields and interviews suggest two reasons. First, intrinsic incentives may be insufficient. As one

²³ This likely underestimates the effect of pay levels on motivation, since the question focused on “strong performance.” If pay is a hygiene factor, a low quantum of pay demotivates, while high pay does not by itself motivate. A director explained that “most CEOs want to be paid fairly, so it’s a demotivator if they aren’t as opposed to a motivator.”

interviewee explained, only a “superhuman” CEO would be willing to perform at her very best without financial incentives.²⁴ Second, intrinsic incentives may lead to CEO actions that do not increase firm value. Examples given by interviewees include increasing the scale of the business, R&D for scientific curiosity, or designing the highest-quality product even if a low-cost strategy would be more effective.

The popularity of this response is interesting also because many CEOs have substantial equity holdings. Thus, even if financial incentives are needed, it is not clear why they need to be provided by variable pay. Interviews and free text fields provided three explanations. First, pay incentives are different from portfolio incentives because they provide recognition.²⁵ Directors explained that variable pay is used “so the CEO would directly and quickly feel the impact of good and (where relevant) poor short-term performance” and “to recognize achievement – the retrospective acknowledgement of exceptional performance is important.” This mechanism suggests that the role of incentives may be somewhat different to that assumed in standard theories. In such models, variable pay at $t=1$ provides ex ante effort incentives at $t=1$. When the CEO decides her effort level at $t=1$, she estimates the marginal utility of the financial benefit from increasing effort across all particular states, and then aggregates across states. If variable pay provides sufficiently high expected marginal utility, she will exert effort at $t=1$. Our results suggest that variable pay may have an additional role – it ensures that the CEO is recognized ex post for her actions at $t=1$, so that she remains intrinsically motivated to exert effort at $t=2$.

The second reason is that other employees are offered variable pay. One director pointed out that “variable pay is an organization wide practice ... difficult to think of CEO scheme in isolation,”

²⁴ Hartzell, Parsons, and Yermack (2010) show that even church clergy receive incentive pay, despite intrinsic motivation being presumably strong.

²⁵ A complementary explanation is that variable pay is immediately received and the CEO enjoys “realization utility” (Barberis and Xiong, 2012). Even though the CEO’s equity holdings rise in value with good performance, the CEO cannot realize this gain for many years due to vesting and holding periods.

another that “a high proportion of variable pay runs through all levels of the organization (commission at lower levels, bonuses at higher levels) and it therefore feels appropriate and a cultural alignment for the CEO to have a high mix of variable pay.” While internal equity comparisons are typically about the level of pay (e.g., pay ratios), the comparison of pay structures has received less attention.

The third reason is that variable pay can be based on criteria other than the stock price. One director explained how CEOs are set business plans with key performance indicators (“KPIs”), and tying pay to these KPIs holds management accountable. He also noted that CEO actions have a greater effect on these KPIs than the stock price. Another director argued that the company’s KPIs are only credible to employees and investors if they are incorporated into the CEO’s contract. Thus, even if KPIs ultimately improve the stock price, so the stock price is a “sufficient statistic”, there might be value to including KPIs in the contract to create a performance culture within the firm.

The second-most popular rationale for incentive pay among investors (79%/1.14) and third-most among directors (84%/1.16) was a response strongly contradicted by theory: “so that the CEO shares risks with investors and stakeholders, even if out of the CEO’s control.” While this implies inefficient risk-sharing, several respondents argued that it is unfair to insulate CEOs from a downturn. Free-text fields emphasized the importance of “shareholder alignment” and “to mirror shareholder experience.” One investor, in an interview, said that CEOs should be co-owners as they will be “there for the journey”; in a downturn, “it’s not fair that I have to take the pain and you don’t.” Thus, one reference point in Y , the vector that directors and investors use to assess fairness, may depend on shareholder returns. While theoretically a board could argue “we’re not cutting the CEO’s pay because she’s risk-averse; by insulating her from downturns outside her control, we were able to pay her less in expected value terms,” investors and stakeholders are unlikely to accept such an argument – particularly since they do not see the counterfactual contract that would have been offered without this insurance.

A rationale for incentive pay studied by in standard models is screening (e.g., Lazear (2005)), which we tested with “to attract/retain a high-ability or hard-working CEO.” This also received strong support (87%/1.19 from directors and 69%/0.85 from investors). We also offered a response of “to motivate the CEO to improve outcomes other than long-term shareholder value.” Interestingly, there was only modest support (52%/0.46 from directors and 53%/0.47 from investors), despite environmental, social, and governance (“ESG”) targets becoming increasingly important. Respondents may believe that alignment with long-term shareholder value already causes the CEO to take stakeholders into account, or that intrinsic incentives are sufficient. One investor wrote “What kind of outcomes, other than long-term shareholder value? Do CEOs really need incentives to ‘do the right thing?’ ” An interviewee said that ESG targets would backfire as no targets capture the totality or even majority of ESG performance; another argued that such targets would cause the CEO to improve only the ESG dimensions in the contract.

Directors (49%/0.37) and investors (15%/-0.45) disagreed on whether it is important “to match peer firm practice.” This highlights an interesting paradox – recall from Table 6 that directors report that investors and their advisors (proxy agencies) force them to follow market practice more than they would like. Our results here, however, suggest that many investors appreciate heterogeneity – thus, directors may have more latitude to tailor the structure of pay than they think.

5.3 *The Determinants of Variable Pay*

In Q9, we ask “What determines the split between variable and fixed pay?” This question tests theoretical predictions for the level of incentives. Table 14 reports the results. Unexpectedly, the lowest responses were “CEO personal risk appetite” (22%/-0.46 for directors and 20%/-0.45 for investors) and “how risky our firm is” (16%/-0.44 and 47%/0.29).²⁶ These variables are key drivers

²⁶ Beta testing identified “risk appetite” as the best way to translate “risk aversion” into practitioner language.

of incentives in classic models such as Holmstrom and Milgrom (1987) – in theory, the higher firm risk and CEO risk aversion, the greater the compensating differential the CEO requires for variable pay. However, if the motivation for rewarding good performance is recognition and fairness, this trade-off is moot; instead, pay variability is driven by what is perceived to be the fair reward for performance.

The low importance respondents attached to firm risk is consistent with the mixed evidence for the link between risk and incentives summarized in Prendergast (1992), as well as with models predicting no link such as Prendergast (1992), Edmans, Gabaix, and Landier (2009), and Edmans and Gabaix (2011). The low importance attached to risk aversion is consistent with the weak relationship with incentives documented by Becker (2006).

The most popular response was “how much the CEO can affect firm performance” (62%/0.66 for directors and 75%/0.98 for investors). While consistent with standard models (e.g. Holmstrom and Milgrom, 1987), their mechanism is that, if effort is less effective, the principal induces less effort as it is not worth the risk premium required to do so; thus, incentives fall. This is inconsistent with the low support for the relevance of risk, and also the results of Table 3 that directors and investors consider incentives to be much more important than keeping the level of pay down. None of the interviews pointed to this mechanism but instead to a different one – if the CEO has a greater effect on performance, it is fair to reward her more for good performance.

The next two most popular responses from directors are not predicted by standard models: “investor or proxy advisor expectations” (60%/0.55), and “the split between fixed and variable pay in peer firms” (49%/0.37). Thus, many directors do not set incentives from first principles but follow market practice. Free-text responses included “The benchmark seemed to be set at roughly a third for each of salary, bonus & shares. ‘This is what everyone else does’ ” and “RemCos are being increasingly forced to ‘fit’ genuine motivational adjustments to pay into a rigid framework [...]”

governed by superficial numerical comparisons with other companies.” Again, this is surprising given that investors claim not to consider peer firm practices as important (Table 13).

5.4 *Long-Term Incentives*

Classic theories of managerial myopia (e.g., Stein (1988)) highlight the erosion of shareholder value that arises if CEO pay is tied to the short-term stock price. A natural solution is to pay the CEO according to long-term performance (Edmans et al., 2012). Even if the CEO demands a compensating differential for the greater risk, this may be outweighed by the benefits of superior decisions. However, horizons are short in practice (Gopalan et al., 2014) and lead to CEOs taking actions to boost short-term profits and stock prices (Edmans, Fang, and Lewellen, 2017; Ladika and Sautner, 2020), potentially at the expense of firm value (Edmans, Fang, and Huang, 2021). Q10 studies the reasons for this apparent disconnect between theory and practice, asking “What would happen if you made the CEO’s incentives more long-term?”

Table 15 reports the results. By far the most popular response from investors was “the CEO would make better decisions” (78%/1.14). In contrast, the three responses that suggest negative consequences – “the incentives would lose their effectiveness”, “we would have to pay the CEO more, which would outweigh any benefits”, and “we would be unable to attract/retain the CEO we want” – all scored below -0.8, with at most 6% agreeing with each concern.²⁷ As one fund manager wrote, “This would be a win win win win win. It would weed out CEOs that are in it for a quick buck, it would focus on long-term outcomes, and it would align CEOs with shareholders. If I could have a single bullet to improve corporate governance, this would be it.” Another said that “We would get

²⁷ One potential reason for the low response to the last option is that more long-term incentives may have opposite effects on attraction and retention. They may deter a CEO from joining, but once a CEO has joined they may encourage retention if forfeited upon departure (Jochem, Ladika, and Sautner, 2018).

better alignment between CEO and owners. It is ridiculous that industries with a 5, 10, 15 year business/product cycle have a 1 and 3 year incentive program.”

Directors view the world very differently. “The CEO would make better decisions” obtained the weakest response (21%/-0.40), while the three responses stating concerns scored between 0.1 and 0.2, with 38-44% agreeing with each. In the free text fields, some directors explained that the incentives they provide are already sufficiently long-term and that further lengthening would reduce their effectiveness. Others argued that shareholders are short-termist and would object. This discrepancy between investors’ stated preferences and directors’ views of investor preferences is interesting, and echoes the mismatch on investors’ preferences for tailoring.

5.5 Relative Performance Evaluation

Holmstrom (1982) showed that performance should be benchmarked against peers, to filter out fluctuations caused by external factors. Doing so would reduce the CEO’s risk, allowing the board to lower the cost of compensation. Indeed, in their critique of CEO pay, Bebchuk and Fried (2004) highlighted the lack of RPE as prime evidence for rent extraction. While recent studies show that the use of relative performance evaluation (“RPE”) is greater than in the past (see the survey by Edmans, Gabaix, and Jenter (2017)), it is far from universal.

Q11a asks “Do you filter out industry conditions from all performance measures (e.g. by benchmarking against peers)?” Table 16 reports the results. 63% of directors and 75% of investors responded “No.” To those respondents, Q11b asks why they believe universal benchmarking to be undesirable. The most popular answer among directors (43%/0.44, versus 33%/0.05 from investors) was that “the CEO should benefit from an industry upswing, since investors and stakeholders do.” This response contradicts efficient risk-sharing, but is consistent with notions of fairness in two ways. First, if investors have benefited from windfalls due to good market conditions, it may be seen as fair for the CEO to also benefit. This echoes findings from the ultimatum game that have been replicated

in a wide variety of settings. One player receives a windfall; if he does not give a significant share to the second player, the latter takes an action that harms both. Second, not benchmarking on the downside (see Table 13) means it is fair not to do so on the upside.

The next two highest responses from directors were “It is too difficult to define an appropriate peer group” (43%/0.20, versus 29%/-0.06 for investors) and “We don’t have information on peer performance for some measures” (47%/0.17, 34%/-0.12). These are considerations absent from all models, which assume that a peer group exists and peer performance is observable. One director explained that “for a large firm, there are few if any comparators which are similar enough.” An interviewee gave the example of the mining sector, where there are only three large players (BHP, Anglo American, and Rio Tinto) with very different portfolios. On the observability of peer performance, one director wrote that “particularly non-financial measures are hard to benchmark.”²⁸

Investors responded most positively to “benchmarking all performance measures would lead to the CEO mimicking peers” (41%/0.14), but directors did not (27%/-0.23). The model of Zwiebel (1995) showed that benchmarking could lead to the CEO taking insufficient good risk, but the free-text responses did not raise this concern. Instead, they pointed out that mimicry could lead to firms taking excessive bad risk (such as over-leveraging if peers are over-leveraging) or short-termist actions (cutting investment to boost margins if peers are doing so).

We also explored other theories for the lack of RPE – “Relative performance measures are less motivating for the CEO” (Dittmann, Maug, and Spalt, 2013), “In an industry upswing, not benchmarking performance keeps our pay competitive with peers” (Oyer, 2004), and “The CEO is responsible for choosing which industries our firm operates in” (Gopalan, Milbourn, and Song, 2010) – but these theories received little support.

²⁸ Another, in an interview, pointed out that some measures of peer performance are only observable with a lag in the peer’s annual report.

There are more complex theories of pay-for-luck. For example, Axelson and Baliga (2009) show that, for a contract to be renegotiation-proof, the CEO must have private information that causes her to have a different view from the board on the value of her long-term pay. Industry prospects are an example of such private information, and so it can be efficient to make the contract contingent upon them. We did not test such theories because of the “as if” critique – they are so intricate that respondents may be unaware they are a driver. It may be that these alternative theories do explain pay-for-luck in reality. However, applying Occam’s razor, a more important reason may be the inability to define an appropriate peer group or observe performance, or that pay-for-luck is not a concern to begin with.

5.6 *Summary*

Our questions on the structure of pay yield the following conclusions:

1. Directors and investors consider intrinsic motivation and personal reputation to be the most important sources of incentives for CEOs.
2. While the primary reason for variable pay is to motivate the CEO to improve long-term shareholder value, this is not only because the CEO obtains utility from consuming the additional pay from good performance. Instead, variable pay provides ex-post recognition of good performance, addressing the CEO’s fairness concerns and boosting her reputation.
3. How much the CEO can affect firm performance is the main determinant of pay variability. Directors view peer firm practice and investor or proxy advisor expectations as important constraints, hindering them from tailoring pay – even though investors themselves do not consider following peer practice as important. Firm risk and CEO risk aversion are not important determinants.
4. Investors strongly believe that lengthening the horizon of CEO incentives would improve decision making, with few adverse consequences. Directors disagree. Some directors are

concerned about the attraction/retention effects of such a change; others believe that incentives would become less effective.

5. Most directors and, in particular, investors, believe that benchmarking of CEO performance measures should not be universal. One reason is that it is fair for CEO pay to mirror the shareholder experience. A second is that, for many companies, it is difficult to define an appropriate peer group or obtain information on peer performance.

6. Conclusion

This paper surveyed directors and investors on the objectives, constraints, and determinants of CEO pay. Our results show that many standard assumptions of executive pay models do not describe how pay is actually set, and we suggest alternative assumptions to bring the models closer to reality.

Boards face a much broader set of constraints than participation and incentive compatibility, frequently causing them to offer lower levels of pay and more one-size-fits-all structures than they prefer. The strongest constraint is the need to obtain shareholder approval, suggesting that directors and investors disagree on how to maximize shareholder value. Investors perceive the need to avoid controversy with employees, customers, and policymakers as important additional constraints.

Even for the standard constraints of participation and incentive compatibility, there is significant disagreement on their importance. Investors believe incentives could be tightened and the participation constraint to be slack. They wish boards to take tougher stances on the level of pay and align the structure more to long-term shareholder value. In contrast, directors believe that investors underestimate the difficulties of attracting and retaining CEOs in the managerial labor market, and that implementing investors' wishes would demotivate the CEO or precipitate her departure.

Turning to the determinants of pay, we find that fairness concerns play an important role in both the level and structure of CEO pay. Starting with the level of pay, investors and especially directors

believe that the CEO needs to be paid at competitive levels, even absent any recruitment or retention concerns, because the failure to do so would be viewed as unfair and undermine the CEO's intrinsic motivation. CEOs are believed to assess their pay against their expectation of a fair reward, rather than based only on the consumption utility it provides.

Moving to the structure of pay, both directors and investors believe that pay should be linked to performance, even though they view financial incentives as less important motivators than intrinsic motivation and the CEO's personal reputation. Financial incentives are believed to interact with these other drivers – not being rewarding for good performance would be seen as unfair by the CEO and undermine her motivation, but visibly doing so reinforces it. This suggests that incentive pay is valuable because it provides ex-post recognition of performance, in addition to consumption incentives. This in turn implies that pay incentives, by delivering greater recognition, play a special role over and above portfolio incentives, whereas standard models view them as fungible.

The survey responses and interviews identify two other fairness considerations that explain the link between pay and performance. One is that CEOs are expected to share external shocks with investors and stakeholders, in contrast to optimal risk-sharing. A second is that, if employees' pay is linked to their performance, it is fair for the CEO's pay to be similarly sensitive.

Our results point towards a considerably more complex but also more interesting model of CEO pay than currently used in the academic literature. Investors and especially directors believe that CEOs evaluate their compensation relative to a set of reference points, such as the pay of other CEOs, their past pay, and their perceived contribution to the firm. In turn, directors and investors evaluate CEO pay relative to a set of potentially different reference points, such as the pay of other CEOs, past CEO pay, the pay of employees and other top executives, and shareholder returns.

Our findings suggest a number of potential directions for future research. Starting with theory, the standard assumption of a single principal – a shareholder-aligned board – does not capture the

complexity of the pay-setting process. The opposite assumption of the board maximizing pay, implicit in the “rent-extraction” view, is also unrealistic. Instead, pay is set by a board that seeks to maximize shareholder value, but also must obtain the approval of shareholders who have different information, beliefs, or objectives. Our results also call for models where pay is influenced by fairness concerns, felt by investors, directors, and CEOs, with a multitude of potential reference points.

Theorists may consider some of the practices we document here – such as following peer practice rather than designing contracts from first principles – as suboptimal and would like to study how pay “should” be set. If so, they should acknowledge that their models are normative rather than positive. As a result, it may not be appropriate to evaluate them according to their empirical consistency but instead the realism of their assumptions, which our survey may help guide.

The survey results also suggest that certain inefficient features of observed contracts may not be as puzzling as previously believed, so they may not need to be “explained” by future models. For example, if pay-for-luck is indeed determined by fairness considerations and the difficulty of defining a peer group and observing peer performance, then there is less need for models justifying pay-for-luck. Similarly, if variable pay is driven by the need to provide recognition rather than consumption incentives, the mixed evidence on the link between incentives and risk is less puzzling.

Future empirical analyses might further distinguish between the “weak/uninformed boards” and “uninformed investors” explanations for the disagreements between directors and investors. For example, researchers could study how deep the labor market for CEOs actually is, and what are the consequences (for either CEO retention or performance) of changes to the level or structure of pay that make the contract less attractive. These consequences might differ according to whether these changes are made to one firm in isolation, or across the board. Another implication is that pay incentives and portfolio incentives may not be fungible and thus should be separated out in empirical

analyses. Finally, it would be fruitful to study how important fairness is in executive pay, and what reference points CEOs, directors, and investors use to assess whether CEO pay is fair.

Table 3

Q1: Rank the importance of the following goals when setting CEO pay, by dragging the options below (1=most important, 3=least important)

The first row of responses for each option (not italicized) is from directors, the second row (italicized) is from investors.

	Mean	1	2	3	N
Attract/retain the right CEO	1.39	65%	32%	4%	203
	<i>1.64</i>	<i>44%</i>	<i>48%</i>	<i>8%</i>	<i>159</i>
Design a structure that motivates the CEO	1.70	34%	61%	5%	203
	<i>1.56</i>	<i>51%</i>	<i>42%</i>	<i>7%</i>	<i>159</i>
Keep the quantum of pay down	2.90	1%	8%	91%	203
	<i>2.80</i>	<i>5%</i>	<i>10%</i>	<i>85%</i>	<i>159</i>

Table 4

Q2a: How large a sacrifice in shareholder value would you make to avoid controversy on CEO pay? (1=none, 2=small sacrifice, 3=moderate sacrifice, 4=large sacrifice)

Investors: How large a sacrifice in shareholder value would you tolerate firms making to avoid controversy on CEO pay?

Q2b: How important is it to avoid controversy with the following parties? (-2=not at all important, 2=very important)

The first row of responses for each option (not italicized) is from directors, the second row (italicized) is from investors.

Panel A							
	Mean	1	2	3	4	N	
How large a sacrifice in shareholder value would you make to avoid controversy on CEO pay?	1.92	33%	44%	20%	3%	197	
<i>How large a sacrifice in shareholder value would you tolerate firms making to avoid controversy on CEO pay?</i>	<i>1.74</i>	<i>44%</i>	<i>40%</i>	<i>13%</i>	<i>3%</i>	<i>153</i>	
Panel B							
	Mean	-2	-1	0	1	2	N
Investors	1.24 ^{a,a}	0%	2%	9%	50%	38%	128
<i>Other investors</i>	<i>0.24 ^{c,a}</i>	<i>6%</i>	<i>23%</i>	<i>27%</i>	<i>30%</i>	<i>14%</i>	<i>84</i>
Employees	0.69 ^{a,a}	4%	7%	27%	41%	21%	128
	<i>1.26 ^{a,a}</i>	<i>0%</i>	<i>6%</i>	<i>12%</i>	<i>32%</i>	<i>50%</i>	<i>84</i>
Proxy advisors	0.45 ^{a,a}	2%	12%	38%	34%	13%	128
	<i>-0.12 ^{-a}</i>	<i>10%</i>	<i>32%</i>	<i>29%</i>	<i>20%</i>	<i>10%</i>	<i>84</i>
Customers	0.20 ^{c,a}	9%	25%	22%	24%	20%	128
	<i>1.14 ^{a,a}</i>	<i>1%</i>	<i>7%</i>	<i>17%</i>	<i>26%</i>	<i>49%</i>	<i>84</i>
Policymakers	0.00 ^{-a}	5%	30%	32%	23%	9%	128
	<i>0.92 ^{a,a}</i>	<i>2%</i>	<i>5%</i>	<i>27%</i>	<i>30%</i>	<i>36%</i>	<i>84</i>
Media	-0.05 ^{-,-}	6%	27%	37%	23%	5%	128
	<i>0.17 ^{-,-}</i>	<i>8%</i>	<i>21%</i>	<i>27%</i>	<i>31%</i>	<i>12%</i>	<i>84</i>

The first superscript after the mean score reports whether it is significantly different from zero, the second superscript whether the means are significantly different for directors and investors. a, b, and c represent statistical significance at the 1%, 5%, and 10% level, respectively.

Table 5

Q12a: Have any of the following ever caused you to offer a lower quantum of CEO pay than you would like? (Y/N)

Q12b: Did this lower quantum ever lead to the following consequences?

Panel A			
	Yes	No	N
Risk of investor opposition	60%	40%	172
Risk of “vote against” recommendation from a proxy advisor	53%	47%	172
Restrictions from our existing approved pay policy	44%	56%	172
Risk of controversy with employees, the media, customers, or policymakers	37%	63%	172
Unwillingness to deviate substantially from how we have paid in the past	28%	72%	172
Panel B			
	Yes	No	N
The CEO was less motivated	42%	58%	132
There were no adverse consequences	41%	59%	132
We hire a less expensive CEO	13%	87%	132
The CEO left	7%	93%	132

Table 6

Q13a: Have any of the following ever caused you to offer an inferior structure of CEO pay to what you would like? (Y/N)

Q13b: Was the structure inferior in the following ways?

Panel A			
	Yes	No	N
Risk of “vote against” recommendation from a proxy advisor	54%	46%	170
Risk of investor opposition	54%	46%	170
Restrictions from our approved pay policy	40%	60%	170
Restrictions from regulation or governance codes	36%	64%	170
Risk of controversy with employees, the media, customers, or policymakers	29%	71%	170
Unwillingness to deviate substantially from how we have paid in the past	16%	84%	170
Adverse tax, accounting, or disclosure implications	10%	90%	170
Panel B			
	Yes	No	N
We followed market practice more	69%	31%	123
We offered less upside for good performance	65%	35%	123
We used (more) performance conditions	57%	43%	123
We made incentives more long-term	40%	60%	123
We made incentives more short-term	13%	87%	123

Table 7**Q3: How important are the following factors in determining the target quantum of pay for a new CEO? (-2=not at all important, 2=very important)**

The first row of responses for each option (not italicized) is from directors, the second row (italicized) is from investors.

	Mean	-2	-1	0	1	2	N
The new CEO's ability	1.29 ^{a,b}	4%	2%	9%	31%	54%	188
	<i>1.49^{a,b}</i>	<i>0%</i>	<i>3%</i>	<i>7%</i>	<i>27%</i>	<i>63%</i>	<i>145</i>
CEO pay at peer firms	0.82 ^{a,a}	1%	8%	24%	41%	26%	188
	<i>0.46^{a,a}</i>	<i>5%</i>	<i>9%</i>	<i>37%</i>	<i>33%</i>	<i>16%</i>	<i>145</i>
How attractive our firm is to run (e.g. prestige, risk, complexity)	0.76 ^{a,-}	4%	7%	22%	45%	22%	188
<i>How attractive the firm is to run (e.g. prestige, risk, complexity)</i>	<i>0.61^{a,-}</i>	<i>3%</i>	<i>10%</i>	<i>26%</i>	<i>43%</i>	<i>17%</i>	<i>145</i>
The new CEO's other employment options	0.55 ^{a,b}	6%	11%	26%	38%	20%	188
	<i>0.26^{a,b}</i>	<i>6%</i>	<i>16%</i>	<i>34%</i>	<i>32%</i>	<i>11%</i>	<i>145</i>
The new CEO's pay in their previous position	0.26 ^{a,a}	5%	15%	38%	32%	9%	188
	<i>-0.21^{a,a}</i>	<i>10%</i>	<i>26%</i>	<i>41%</i>	<i>20%</i>	<i>3%</i>	<i>145</i>
How financially motivated the new CEO is	0.07 ^{-b}	9%	20%	35%	30%	7%	188
	<i>-0.23^{b,b}</i>	<i>14%</i>	<i>23%</i>	<i>39%</i>	<i>19%</i>	<i>5%</i>	<i>145</i>
The outgoing CEO's pay	-0.02 ^{-a}	7%	26%	35%	28%	5%	188
	<i>-0.55^{a,a}</i>	<i>18%</i>	<i>37%</i>	<i>30%</i>	<i>11%</i>	<i>4%</i>	<i>145</i>

The first superscript after the mean score reports whether it is significantly different from zero, the second superscript whether the means are significantly different for directors and investors. a, b, and c represent statistical significance at the 1%, 5%, and 10% level, respectively.

Table 8

Q4: What causes you to increase the target quantum of pay for an incumbent CEO? (-2=strongly disagree, 2=strongly agree)

Investors: What causes you to support increases to the target quantum of pay for an incumbent CEO?

The first row of responses for each option (not italicized) is from directors, the second row (italicized) is from investors.

	Mean	-2	-1	0	1	2	N
Good recent CEO performance	0.98 ^{a,-}	3%	7%	15%	41%	34%	186
	<i>1.05^{a,-}</i>	<i>0%</i>	<i>5%</i>	<i>20%</i>	<i>41%</i>	<i>35%</i>	<i>142</i>
Increase in firm size	0.37 ^{a,c}	4%	15%	35%	33%	13%	186
	<i>0.17^{c,c}</i>	<i>9%</i>	<i>15%</i>	<i>30%</i>	<i>39%</i>	<i>6%</i>	<i>142</i>
Increase in pay at peer firms	0.26 ^{a,a}	3%	16%	37%	38%	5%	186
	<i>-0.17^{b,a}</i>	<i>13%</i>	<i>20%</i>	<i>40%</i>	<i>25%</i>	<i>2%</i>	<i>142</i>
Increased threat of CEO leaving	0.25 ^{a,a}	5%	17%	35%	35%	8%	186
	<i>-0.06^{-a}</i>	<i>8%</i>	<i>24%</i>	<i>38%</i>	<i>27%</i>	<i>3%</i>	<i>142</i>
Changes in attractiveness (e.g. prestige, risk, complexity) of CEO job at your firm	0.23 ^{a,-}	6%	17%	33%	34%	9%	186
<i>Changes in attractiveness (e.g. prestige, risk, complexity) of CEO job at their firm</i>	<i>0.25^{a,-}</i>	<i>8%</i>	<i>13%</i>	<i>34%</i>	<i>36%</i>	<i>9%</i>	<i>142</i>
Other changes that reduce the attractiveness of the pay package (e.g. adding holding periods)	-0.11 ^{-,-}	8%	26%	38%	25%	3%	186
	<i>0.01^{-,-}</i>	<i>7%</i>	<i>23%</i>	<i>40%</i>	<i>21%</i>	<i>8%</i>	<i>142</i>
Changes in attractiveness (e.g. prestige, risk, complexity) of CEO jobs at other firms	-0.28 ^{a,-}	10%	30%	41%	16%	3%	186
	<i>-0.37^{a,-}</i>	<i>10%</i>	<i>34%</i>	<i>40%</i>	<i>15%</i>	<i>1%</i>	<i>142</i>

The first superscript after the mean score reports whether it is significantly different from zero, the second superscript whether the means are significantly different for directors and investors. a, b, and c represent statistical significance at the 1%, 5%, and 10% level, respectively.

Table 9

Q5a: Have you ever significantly decreased the target quantum of pay for an incumbent CEO?
Investors: Have you ever requested significant decreases to the target quantum of pay for an incumbent CEO?

Q5b: What caused you to decrease the target quantum of pay for an incumbent CEO?
 (-2=strongly disagree, 2=strongly agree)
Investors: What caused you to request decreases to the target quantum of pay for an incumbent CEO?

The first row of responses for each option (not italicized) is from directors, the second row (italicized) is from investors.

Panel A							
		Yes	No	N			
Have you ever significantly decreased the target quantum of pay for an incumbent CEO?		23%	77%	186			
<i>Have you ever requested significant decreases to the target quantum of pay for an incumbent CEO?</i>		65%	35%	142			
Panel B							
	Mean	-2	-1	0	1	2	N
External pressure to reduce pay (e.g. from investors, the media, policymakers)	0.15 ^{-c}	20%	10%	24%	29%	17%	41
<i>External pressure to reduce pay (e.g. from investors, the media, policymakers)</i>	<i>-0.28 ^{b,c}</i>	<i>19%</i>	<i>20%</i>	<i>33%</i>	<i>23%</i>	<i>4%</i>	<i>93</i>
Your firm encountering financial constraints	0.07 ⁻	32%	12%	5%	20%	32%	41
<i>Your firm encountering financial constraints</i>	<i>0.53 ^{a,-}</i>	<i>13%</i>	<i>9%</i>	<i>20%</i>	<i>29%</i>	<i>29%</i>	<i>93</i>
The CEO requesting it*	-0.37	49%	0%	10%	22%	20%	41
Poor recent CEO performance	-0.41 ^{-a}	41%	10%	15%	17%	17%	41

	<i>-0.45^{a,-}</i>	<i>19%</i>	<i>30%</i>	<i>32%</i>	<i>19%</i>	<i>1%</i>	<i>135</i>

The first superscript after the mean score reports whether it is significantly different from zero, the second superscript whether the means are significantly different for directors and investors. a, b, and c represent statistical significance at the 1%, 5%, and 10% level, respectively. *Only directors were asked this question.

Table 15**Q10: What would happen if you made the CEO's incentives more long-term? (-2=very unlikely outcome, 2=very likely outcome)*****Investors: What would happen if companies made CEO incentives more long-term?***

The first row of responses for each option (not italicized) is from directors, the second row (italicized) is from investors.

	Mean	-2	-1	0	1	2	N
The incentives would lose their effectiveness	0.20 ^{b,a}	6%	25%	25%	31%	13%	177
<i>We would have to pay the CEO more, which would outweigh any benefits</i>	<i>-0.98^{a,a}</i>	<i>30%</i>	<i>44%</i>	<i>21%</i>	<i>4%</i>	<i>1%</i>	<i>135</i>
<i>The CEO would need to be paid more, which would outweigh any benefits</i>	<i>0.14^{c,a}</i>	<i>7%</i>	<i>18%</i>	<i>37%</i>	<i>29%</i>	<i>9%</i>	<i>177</i>
We would be unable to attract/retain the CEO we want	-0.81 ^{a,a}	19%	51%	24%	4%	2%	135
<i>The board would be unable to attract/retain the CEO it wants</i>	<i>0.13^{-,a}</i>	<i>7%</i>	<i>19%</i>	<i>34%</i>	<i>31%</i>	<i>8%</i>	<i>177</i>
The CEO would make better decisions	-0.95 ^{a,a}	28%	45%	21%	4%	1%	135
	-0.40 ^{a,a}	21%	25%	32%	15%	7%	177
	<i>1.14^{a,a}</i>	<i>1%</i>	<i>4%</i>	<i>16%</i>	<i>34%</i>	<i>44%</i>	<i>135</i>

The first superscript after the mean score reports whether it is significantly different from zero, the second superscript whether the means are significantly different for directors and investors. a, b, and c represent statistical significance at the 1%, 5%, and 10% level, respectively.

Table 16

Q11a: Do you filter out industry conditions from all performance measures (e.g. by benchmarking against peers)?

Investors: Do you believe that industry conditions should be filtered out from all performance measures (e.g. by benchmarking against peers)?

Q11b: Why don't you filter out industry conditions from all performance measures? (-2=strongly disagree, 2=strongly agree)

Investors: Why don't you believe that industry conditions should be filtered out from all performance measures?

The first row of responses for each option (not italicized) is from directors, the second row (italicized) is from investors.

Panel A							
		Yes	No	N			
Do you filter out industry conditions from all performance measures		37%	63%	175			
<i>Do you believe that industry conditions should be filtered out from all performance measures?</i>		25%	75%	135			
Panel B							
	Mean	-2	-1	0	1	2	N
The CEO should benefit from an industry upswing, since investors and stakeholders do	0.44 ^{a,a}	2%	9%	46%	29%	14%	107
<i>CEOs should benefit from an industry upswing, since investors and stakeholders do</i>	<i>0.05 ^{-a}</i>	<i>8%</i>	<i>19%</i>	<i>40%</i>	<i>24%</i>	<i>8%</i>	<i>98</i>
It is too difficult to define an appropriate peer group	0.20 ⁻⁻	12%	21%	23%	21%	22%	107
<i>We don't have information on peer performance for some measures</i>	<i>-0.06 ⁻⁻</i>	<i>9%</i>	<i>26%</i>	<i>37%</i>	<i>19%</i>	<i>9%</i>	<i>98</i>
We don't have information on peer performance for some measures	0.17 ⁻⁻	18%	14%	21%	27%	20%	107
<i>The board doesn't have information on peer performance for some measures</i>	<i>-0.12 ⁻⁻</i>	<i>14%</i>	<i>26%</i>	<i>27%</i>	<i>26%</i>	<i>8%</i>	<i>98</i>
Investors don't want us to filter out industry conditions*	0.11	8%	14%	46%	21%	10%	107
Benchmarking all performance measures would lead to the CEO mimicking peers	-0.23 ^{b,b}	12%	29%	32%	24%	3%	107
<i>Relative performance measures are less motivating for the CEO</i>	<i>0.14 ^{-b}</i>	<i>10%</i>	<i>19%</i>	<i>30%</i>	<i>28%</i>	<i>13%</i>	<i>98</i>
Relative performance measures are less motivating for the CEO	-0.26 ^{a,-}	11%	32%	33%	21%	4%	107
<i>Relative performance measures are less motivating for CEOs</i>	<i>-0.46 ^{a,-}</i>	<i>18%</i>	<i>36%</i>	<i>24%</i>	<i>16%</i>	<i>5%</i>	<i>98</i>
In an industry upswing, not benchmarking performance keeps our pay competitive with peers	-0.32 ^{a,-}	18%	22%	36%	22%	2%	107
<i>In an industry upswing, not benchmarking performance keeps the pay competitive with peers</i>	<i>-0.17 ^{c,-}</i>	<i>10%</i>	<i>21%</i>	<i>47%</i>	<i>18%</i>	<i>3%</i>	<i>98</i>
The CEO is responsible for choosing what industries our firm operates in	-1.07 ^{a,a}	53%	21%	10%	8%	7%	107
<i>what industries our firm operates in</i>	<i>-0.42 ^{a,a}</i>	<i>18%</i>	<i>33%</i>	<i>29%</i>	<i>13%</i>	<i>7%</i>	<i>98</i>
